

For tanks in Series

for the i^{th} tank

using

$$\text{In} - \text{Out} + \text{Gen} = \text{Acc}$$

$$q_{i-1} C_{Ai-1} - q_i C_{Ai} - k C_{Ai} V = \frac{V dC_{Ai}}{dt}$$

$V = \text{vol}^m \text{ of tank}$

Comparison

- Train has bidirectional movement but tanks have single direction movement
- compartment
- train also has inflow & outflow ~~outside~~ ~~out of the~~ the system but reactor has out movement ~~of~~ compartments
- Both ~~are~~ have relatively same equations for mass balance.
